A video featuring two DePauw University professors has won a Mid-America Emmy Award in the "Informational/Instructional Feature" category. Daniel G. Gurnon, associate professor of chemistry and biochemistry, and Jacob K. Stanley '05, who served as a part-time assistant professor of art, are seen in *Sculpting Proteins*, which was produced by Steve Drake of the Beckman Institute for Advanced Science and Technology at the University of Illinois at Urbana-Champaign. The award was presented last weekend in Kansas City.

"The winning video features Beckman physicist Klaus Schulten and his fellow researchers at the Beckman Institute who have created a computational microscope that can accurately follow the previously unknowable molecular motion that takes place inside living cells," notes an announcement from U of I. "The video shows how these movie-like visualizations inspired physicist-turned-artist Julian Voss-Andreae and DePauw University professors Daniel Gurnon and Jacob Stanley to create a series of steel sculptures depicting the birth of the villin headpiece protein and how it folds into its native state, trillionth of a second by trillionth of a second."

Read more [here](#). The video is embedded below.

Another video of Gurnon and Stanley was featured during last November's national telecast of the Monon Bell Classic. It, too, is available for viewing below.
